1 EXECUTIVE SUMMARY

On the 23rd of November 2025, the University suffered a malware attack. Various artefacts were captured from three different devices such as memory dumps, event logs, browser history, a network capture, firewall system logs and more. This investigation systematically analyzed each of these artefacts with the goal of fully understanding the innerworkings of the malware and how it infected the network.

Upon analyzing the network artefacts, it was found that the malware was sending outbound HTTP requests to unknown external IP addresses. This was concluded to be external C2 infrastructure used by the malware to relay information. Memory dump analysis uncovered the nature and results of the malware. Logs created by the malware were found containing credentials for different accounts and devices as well as other indicators of the malware being a Keylogger. The memory dump, however, did not find any malicious scripts. Registry analysis was crucial to understanding the reasoning behind the lack of presence of a script. It was found that a script “keylogger.ps1” was run on the devices but was stored on the shared network drive which was not an available artefact for this investigation. Finally, headless PowerShell commands were utilized by the malware to hide from detection, also functioning as anti-forensics.

2 INVESTIGATION PLAN

2.1 SCENARIO

The university was the victim of a malware attack recorded to be on the 23rd of November 2025. Three machines have been extracted for various artefacts to be analysed, alongside network logs. The evidence was collected at 13:28:15 on 23/11/25.

2.2 OBJECTIVES

This investigation aims to:

- Determine which host is infected with malware.
- Discover what type of malware was involved.
- Identify network indicators of compromise.
- Build a timeline of the attack.
- Track any lateral movement or data exfiltration attempts by the malware.

2.3 EVIDENCE ARTEFACTS

The evidence artefacts given for this investigation consist of 3 different machines “DESKTOP-841”, “LAPTOP-135” and “WORKSTATION-969”. Each of these contain the following:

- Browser history.
- Event log files.
- A memory dump.
- Network configuration files.
- Prefetch files.
- A registry dump.

The folder also contains a network capture file of the affected hosts as well as system logs from the university’s firewall. Additionally, LAPTOP-135 contains an extra directory, “Malware”.

2.4 FORENSIC TOOLS AND JUSTIFICATION

2.4.1 Wireshark

Wireshark was selected for viewing the packet capture file as it is likely the most known and respected tool for packet analysis.

2.4.2 MemProcFS

MemProcFS allows you to mount a memory dump and attempts to reconstruct its filesystem. It also has automated analysis features pointing out suspicious files and constructing informative CSV files.

2.4.3 DB Browser for SQLite

This tool allows the analyst to view database files in SQLite format preventing the data contained from being modified

2.4.4 RegistryExplorer

Registry Explorer allows registry hives to be explored in search of persistence mechanisms. Additionally, it takes timestamps of recent registry modifications.

2.5 ACPO STATEMENT

To ensure the integrity of this investigation and its findings, ACPO principles were followed. The evidence artefacts are stored both locally and, on the cloud, and the entire investigation takes place on a copy of the evidence. All the work carried out is properly and heavily documented, making it as transparent as possible. A basic python script was written to check the hashes of the artefacts before and after the investigation, which were then compared to check that nothing had been modified (*figure 1, Appendix B & Appendix C*). The only difference found was syslogs.tar as it has been extracted from syslogs.tar.gz to be analyzed, therefore, this was expected.

2.6 METHODOLOGY

Seeing as this project contains a variety of different devices, each one having its own set of evidence artefacts, the devices were systematically analyzed one at a time. After each device's artefacts were analyzed, the documented findings were reviewed to string together the story of what happened in this attack.

In each artefact the analyst will search for:

2.6.1 Network capture and Firewalls Logs Analysis

- Unknown IP addresses
- Abnormal protocols
- Potential Payload delivery
- Note timestamps

2.6.2 Memory Dump Analysis

- Malware scripts
- Traces of malware amongst the file system

2.6.3 Registry Analysis

- Search for suspicious files and scripts
- Deleted files
- Files modified within attack time range

2.6.4 Logs and Browser History Analysis

- Recent downloads
- Visiting strange websites

- System events within attack time range
- PowerShell events within attack time range

After gathering all the evidence, a forensic timeline will be constructed to better understand the nature of the attack.

3 EVIDENCE AND ANALYSIS

The attack took place on 23/11/2025; therefore, all standalone timestamps refer to this date.

3.1 NETWORK TRAFFIC CAPTURE

The network capture file was opened in Wireshark. A filter was applied to only display network traffic from LAPTOP-135's IP address "10.244.22.10" which confirmed that the laptop does not appear once in this network capture (*figure 2*).

The filter was changed to view the traffic on the subnet (*figure 3*). Packets 6, 7, 13 and 21, for example, show "WORKSTATION-969" (10.244.22.11) and "DESKTOP-841" (10.244.22.12) initiating outbound SYN requests to unknown IP addresses. These SYN requests never receive a SYN-ACK response and proceed to regularly retransmit for the duration of the network capture. A filter was set to only display HTTP traffic by only grabbing results on port 443 and cutting out all the retransmissions; this showed that there were many more of these outbound requests to unknown IP addresses (*figure 4*). By applying a filter for the TCP "ACK" flag is true, it became clear that none of these requests ever receives an ACK in this entire network capture (*figure 5*). Using "SMB" as a filter returned 1 packet at timestamp 13:16:45 (*figure 6*). It was sent from the network gateway "10.244.22.1" to the networks broadcast address "10.244.22.255".

3.2 FIREWALL SYSTEM LOGS

System logs extracted from the university firewall were analyzed in Notepad++. The logs were found to display additional information to the PCAP file. It shows traffic from over 40 minutes before the PCAP file starts and displays previously absent LAPTOP-135 network traffic. The first connection was sent out from LAPTOP-135 to an unknown external IP address "172.178.240.162" at 12:30:06. After 20 seconds, one of these connections was observed being transmitted from WORKSTATION-969, and DESKTOP-841 following 8 seconds later (*figures 7, 8 & 9*). Unlike the network capture, when a SYN request is sent to these IP addresses, they mostly respond with an ACK.

3.3 LAPTOP-135 (10.244.22.10)

3.3.1 Network Traffic

Matching the Wireshark network traffic evidence, the "netstat.txt" file does not show any outbound traffic from this device (*figure 10*).

3.3.2 Memory Dump

The memory dump was mounted using MemProcFS (*figure 11*). The "findevil.txt" file can be found in "M:\forensic\findevil" (*figure 12*). This file logs discrepancies in memory structures which help to find signs of manipulation and code injection. Multiple PowerShell instances can be seen running which were flagged as "PE_PATCHED". Process "lsass.exe", a process used for authentication, authorization and

credential management, and process “System”, were flagged with “PE_HDR_SPOOF”. These both reference the system driver “E1G6032E.sys” and imply that code injection into this driver could have been used to carry out exploits, such as credential dumping. Some more processes of note here are “conhost.exe”, “MicrosoftEdgeU”, and “LogonUI.exe”.

Sysinternal’s “Strings.exe” was used to extract strings from the memory dump, this was stored in a text file (*figure 13*). Next, the built-in windows findstr command was used to search for keywords, one being “keylogger” (*figure 14*). This showed many references to the text “SnakeKeyLogger”, a well-known malware family.

The “ROOT/Users/Public/Documents” directory was explored (*figure 15*). One file in this directory is “syslog.dat”, (*figure 16*), which contains credentials extracted from various sources. Lastly, “.winlogon” (*figure 17*), shows a hidden PowerShell terminal executing a keylogger script with a date timestamp in Unix format which is converted back to be 13:13:07.

3.3.3 Malware Directory

Unlike the other devices, the LAPTOP-135 artefact provides an extra directory, “Malware”, for evidence. Two of the files contained within this folder are “browser_data.tmp”, and “PSHistory.txt” (*figures 18 & 19*). The first file shows keylogger malware logs of extracted credentials for a Google Mail account, bank account, and company portal account. The second file contains PowerShell command history displaying three lines of code, the third being of interest. This line “Set-MpPreference -DisableRealtimeMonitoring \$true” disables Windows Defender’s real time protection.

3.3.4 Registry Dump

The “NTUSER.dat” registry dump was searched using Registry Explorer. A PowerShell window was found running a script “sysupdate.ps1” using the same suspicious flags “-WindowStyle Hidden -ExecutionPolicy Bypass” as the other malicious scripts found in this investigation (*figure 20*).

The “SOFTWARE” registry dump (*figure 21 & 22*) found multiple instances of PowerShell activity being carried out between 12:53:24 to 12:58:04, placing it within the attack timeframe. This could be malicious scripts being carried out by the malware.

3.3.5 Logs and Browser History

Microsoft Edge browser history viewed using DB Browser (*figure 23*). Upon inspection, nothing suspicious seemed to be present, the results mostly consisted of legitimate forum websites.

The event viewer logs were viewed. A script “keylogger.ps1” was run in PowerShell from the (Z:) drive (*figure 24*). This file was never found during memory analysis besides in some strings. At 13:15:18 a script, “automated_browsing.ps1”, from the “Malware_Scripts” directory on the shared network drive, was executed in multiple hidden PowerShell instances. It appeared 15 times with two clear separate commands being used (*figures 25 & 26*).

3.4 DESKTOP-841 (10.244.22.12)

3.4.1 Network (Directory)

Similarly to Wireshark, the “netstat.txt” file for this device shows suspicious outbound traffic going to “172.187.46.136” (*figure 27*). The traffic is SYN requests being sent from the process with PID 2260 on the device.

Next the “processes.txt” file was investigated to find the process who owns the PID 2260 (*figure 28*). This PID belongs to “MsMpEng.exe”, otherwise known as Microsoft Malware Protection Engine, which is a part of Windows Defender. This is abnormal behavior as MsMpEng should not be sending beaconing requests to external IP addresses.

3.4.2 Memory Dump

MemProcFS’s “findevil.csv” (*figure 29*) shows the same potentially compromised processes and drivers found on LAPTOP-135. There are some minor differences, however, such as System interacting with additional system drivers and many more PowerShell, conhost, and LogonUI instances.

3.4.3 Registry Dump

Similarly to LAPTOP-135, the SOFTWARE registry found PowerShell activity between 13:04:46 and 13:16:52 (*figure 30 & 31*).

3.4.4 Logs and Browser History

Microsoft Edge browser history inspection found this device has identical results to LAPTOP-135’s history file (*figure 32*).

The PowerShell event logs found “automated_browsing.ps1” running about 40 seconds after its initial launch on LAPTOP-135 at 13:16:47 and displayed 16 PowerShell instances this time (*figure 33 & 34*).

3.5 WORKSTATION-969 (10.244.22.11)

3.5.1 Network Traffic

WORKSTATION-969’s “netstat.txt” file (*figure 35*), displayed similar suspicious traffic to three different IP addresses, having one in common with DESKTOP-841. The last request was sent to “4.250.18.209” from the process with PID “2188” which was identified as MsMpEng (*figure 36*), the same process transmitting suspicious traffic on DESKTOP-841.

3.5.2 Memory Dump

MemProcFS created a “findevil.txt” (*figure 37*). A PowerShell window can be viewed running as user “SYSTEM”, giving it much higher privileges than a legitimate instance generally uses.

3.5.3 Registry Dump

Once again, the PowerShell activity was found during the attack, 13:09:15 to 13:13:42 (*figure 38 & 39*).

3.5.4 Logs and Browser History

The Microsoft Edge browser history was found to be identical to the other two devices (*figure 40*).

The analyst once again found documentation of the “automated_browsing.ps1” script instances in the PowerShell and Security event logs (figures 41, 42 & 43). The script was launched between LAPTOP-135 and DESKTOP-841 at 13:16:06.

3.6 INFECTION TIMELINE

```
12:30:06
|   LAPTOP-135
|   First C2: 172.178.240.162

12:30:26
|   WORKSTATION-969
|   First C2: 135.233.45.222

12:30:34
|   DESKTOP-841
|   First C2: 150.171.27.12

13:13:06
|   LAPTOP-135
|   keylogger.ps1 run

13:13:07
|   LAPTOP-135
|   sysupdate.ps1 executed in hidden terminal
|   browser_data.tmp created
|   .winlogon executed

13:13:23
|   WORKSTATION-969
|   C2 Established: 52.123.128.14
|   2-4 second Beacons begins

13:13:24
|   DESKTOP-841
|   C2 Established: 52.123.129.14

13:15:18
|   LAPTOP-135
|   automated_browsing.ps1 executed in hidden terminal

13:16:06
|   WORKSTATION-969
|   automated_browsing.ps1 executed in hidden terminal

13:16:47
|   DESKTOP-841
|   automated_browsing.ps1 executed in hidden terminal
```

4 FINDINGS AND CONCLUSIONS

4.1 RESULT ANALYSIS

Each artefact had now been carefully examined, and it was found that all three devices contained evidence of the malware's presence. By using the constructed timeline, the malware began by establishing C2 infrastructure. The first logged outbound request was from LAPTOP-135 as early as 12:30:06.

4.1.1 Identical Browser Histories and Laptop Network Anomalies

The investigation found that the Microsoft Edge browser history files seemed to be identical upon first look. A hash was taken of each device's browser history file and compared (*figure 44*). This confirmed that these were all fully identical. This could potentially be due to the devices having a network shared history.

The LAPTOP-135 device was confirmed to have the malware on it through various findings. The syslog.dat file found using MemProcFS showed stolen sensitive information captured by the key logger and the firewall system logs showed C2 traffic activity. This makes it interesting that the network capture did not pick up any traffic from the LAPTOP-135 device.

4.1.2 Malware Infection Vectors

A confirmed infection vector was never found; the tester searched for abnormal USB connection, browser history downloads, and more, but no evidence was found to support them. One highly likely possibility is that the attacker gained access to the shared network (Z:) drive and simply placed it on there.

4.1.3 Network behaviour

The network capture displays strange behaviour as both DESKTOP-841 and WORKSTATION-969 were found sending numerous outbound SYN requests to unknown external IP addresses. This is a strong sign that the malware may be using C2 infrastructure to relay the data captured by the key logger on the compromised devices to the attacker.

4.1.4 Malware Behaviour and Anti-forensics

In LAPTOP-135's PowerShell logs, the script "keylogger.ps1" was run at 13:13:06, which lines up with "browser_data.tmp" and "syslog.dat" logging credentials at 13:13:07 meaning this script was likely ground zero for the data theft. Besides the network drive scripts, the malware seemed to function in a fileless way, using PowerShell instances for most of its actions. Excessive use of conhost.exe suggests the malware is using the process for file execution or evasion techniques. Another clear form of evasion is the use of launching hidden PowerShell instances for commands. Lastly, lsass.exe was flagged by MemProcFS finddevil on every device. This process is well-known to be used by malware to carry out credential dumping attacks.

4.1.5 Persistence and Traversal

Memory analysis on the devices found that many processes and system drivers were flagged as spoofed by MemProcFS and acting strangely. This indicates that the malware potentially injects itself into legitimate windows processes and drivers attempting to avoid detection. It likely uses these to carry out its malicious tasks such as disabling windows defender real time monitoring (found in PSHistory.txt), harvesting credentials, tunnelling to other devices, and covering its tracks with anti-forensic techniques.

A packet was observed using the SMB protocol to the subnet's broadcast address. This packet was sent 2 seconds before "automated_browsing.ps1" was run on DESKTOP-841, this implies that it could have been a traversal method. Another potential method of malware traversal could have been via the shared network drive. As mentioned, the "keylogger.ps1" was found in LAPTOP-135's PowerShell logs, and here it showed the location of this file was in the "Z:/Malware_Scripts" directory. The "Z" drive is the shared network drive, meaning this script could be executed from any device on the network through this directory.

4.1.6 Stolen Data

Two files were found containing stolen credentials, "browser_data.tmp" captured chrome stored passwords. This is strange because the provided artefacts gave Edge history exclusively, meaning there is potential evidence which was not provided in this investigation. The file displays three credentials for Google Mail, Bank account, and a company portal. It also states that 27 credentials have been extracted. The second file "syslog.dat" captures the Google Mail credentials from the last file. Additionally, the bank account number and pin are logged, and a CMD/PowerShell window was used to find the strings "net user administrator NewPass123!". This shows the account name and password to the Administrator account which could have been used for privilege escalation.

4.1.7 Conclusions

When the memory dump's strings were investigated, the keyword "keylogger" was a focus, as at this point this type of malware was a suspicion. This returned many strings, however, "SnakeKeyLogger" seemed to come up repeatedly. SnakeKeyLogger is a well-known malware family which carries out credential theft on devices and trojan infection traversal tactics on networks. It is highly likely that a variant of this is the malware present on the three devices. This conclusion is derived from the numerous similarities between the observed results from this investigation, and the already known features of SnakeKeyLogger malware. This includes credential harvesting, C2 infrastructure to submit credentials, .NET based fileless execution, and process hollowing/ code injection.

Many of the results drawn from this investigation fail to find fully conclusive answers for various reasons. One of these reasons is the absence of useful artefacts, an example being other browser history. The malware logs "syslog.dat" and "browser_data.tmp" find credentials stored in Chrome, however, the investigation only provides Edge browser history. Another case of this is the lack of access to the shared network drive. With this the analyst may have been able to find more traces of the malware and even potentially the script file.

5 RECOMMENDATIONS

The first logged C2 request was sent LAPTOP-135 within 30 seconds of the other devices starting identical suspicious behaviour. However, it was over 43 minutes before the harvested credentials were uploaded to the malware logs. Improved network monitoring is crucial in strengthen security in situation like this. Even after infection, if the malware was caught within that 43-minute window, then it could have been shut down before any harm was caused.

Various of potential attack vectors were available to the malware. One possibility is it could have been simply dropped onto the shared network drive. If this is the case, then a stronger antivirus could be deployed to immediately eliminate files detected as malware. Filesystem monitoring and hashing could be used to check files which manage to make it past this.

Lastly, forensic logging could be setup to help with the investigative process. This could allow a forensic analyst to understand the attack much quicker and potential prevent it before its finished causing harm.
